

1. Project Checkpoints

a. Oct 04 –

- i. I will have researched how to create a browser extension
 - 1. I have read about the basics of creating a browser extension.
 - 2. I have learned that they need a file called manifest.json.
 - 3. I am currently using Chrome as my browser template.
- ii. Build UI template for format styling extension using HTML and CSS. A prototype of what it will look like in Chrome.
 - 1. I have built a very basic template for the format styling. I only have the option available for changing the background color.
 - 2. I'm still playing with how I want this to function. At first I was thinking that as they change the color it would change the background of the page. Now, I'm leaning towards only displaying the change in the template and then the user will okay the changes.
- iii. Create icon.png
 - 1. I haven't had a chance to create this image yet. I will do this after I finish my MVC project. 😊
